The prevalence of image-based falsification on a university-based laboratory database. A retrospective study was conducted to identify the prevalence of image-based falsification in a university-based laboratory database. Data were collected over a three-year period on 663 undergraduate students at one medical school. Data included the routine tests and medications required to be administered to students admitted to university hospital for medical reasons. Images of each student were taken. These images were compared with the students' medical records. Of 663 students, 101 (15.3%) had at least one falsified image on record. A total of 131 (19.8%) students had at least one falsified laboratory image on record. We conclude that image-based falsification on university-based laboratory database occurs frequently in our student population. Laboratory technologists and clinicians should take appropriate action to ensure that images are included in the official record of the student and that the images are of high quality. ♦s the one bit where the new 7.1 Sound Engine might have an advantage over the always-innovating Architecture, and that might come as a surprise. Gaming Action Just like the 7.1 Sound Engine can deliver better bass and treble than the old 7.1 Digital Audio Architecture, it can also do a better job of simulating surround sound as well. The only problem is that neither the 7.1 Sound Engine nor the 7.1 Digital Audio Architecture is ever going to be as good as the surround sound delivered by a standalone system. But at least a 7.1 System-On-A-Chip with the new 7.1 Sound Engine can do more than the 7.1 Digital Audio Architecture when you're running games. The 7.1 Digital Audio Architecture, like every other feature on the Laptop Architecture, can make a system run Games On-The-Go (GOTG). The big problem with these players is that the sound engine they use is located on the PC. So there is no easy way to upgrade them. With the new 7.1 Sound Engine, your choice of games and size of tear-drops are up to you. As much as I'd like to dwell on the gaming aspects of the new 7.1 Sound Engine, I have one more section to take a look at. The Nintendo 64's 7.1

What's New In Adobe Photoshop CC 2014?

Photo: Scott G Winterton/Getty Images Admit it: Many of us consider dessert after dinner to be one of the most delicious parts of the meal. Surely that's one of the greatest pleasures of life? But any proclivities we have toward dessert after dinner could be leading us down a particularly slippery slope. Thanks to the discovery of an Ebola-like virus in the feces of chimpanzees, we might want to avoid the dodgy cheesecake and stick to the orange juice and celery sticks. The Ebola-like virus, known as Ebola virus, is found in the blood of people who have died of the disease. It is so new that a major outbreak has yet to occur. But scientists at the Broad Institute in Cambridge, Massachusetts, discovered Ebola virus in the feces of a chimpanzee who was infected with a virus very similar to the disease in humans. The feces were found after the chimpanzee died of an apparent heart condition and was being prepared for burial. The scientists then used a technique called metagenomic analysis to discover the virus in the chimpanzee's feces. "It's exciting," said Ian Lipkin, MD, the director of the Center for Infection and Immunity at Columbia University's Mailman School of Public Health. "It shows that you don't have to be sick to shed virus in your poop, and it can get into a very different host population, which was one of the hypotheses that was going around." It is still unclear what role this virus might play in human disease, but the discovery will certainly reignite concerns over the spread of diseases that were thought to only occur in sick people. Could a fatality rate as high as more than 90 percent among those infected with Ebola virus have a bottom-feeder, or human, variety lurking in someone's intestines? "We have been spreading a virus that makes it all too easy for it to get into the bloodstream of a human and cause a massive problem," Michael Gale, an expert in Ebola at the University of Southampton, told the BBC. "I think this sheds a lot more concern about casual transmission of the virus, and that's really scary." This study is not the first time scientists discovered an animal virus in humans, but it is the first time scientists have discovered a virus in a chimpanzee's feces. The Ebola-like virus might pose
